

Rep Ken Helm and Committee Members
House Committee on Energy and Environment

The first step in problem solving is to ask what problem are we solving.

In the case of climate, there is utterly NOTHING unusual about today's climate.

It has been warmer before

It has been cooler before

There were more storms previously

There were less storms previously

The rate of change of temperature has been faster in the past.

Same for droughts & floods

Same for all the other crap the alarm industry claims.

Therefore there is nothing to worry about & nothing to explain with
CO2

Same for all the other lies the trillion dollar climate alarm
industry spreads.

If that is not enough evidence then:

CO2 FOLLOWS TEMPERATURE and thus cannot be the cause of
temperature changes.

If you need more evidence:

CO2 went up from 1945(?) to 1970 as temperature declined.

CO2 went up even more from 1995 to present as temperature was
stable.

Arctic warmed MORE in the early 1900s and faster than it did in
the late 1990s which had much more CO2.

Each of the above should be sufficient to prove that we do not have a
"climate problem", thus no need for a legislative "solution".

If you look closely, you will find the people advocating a "climate
solution" are either making money off of the "solutions" (wind, solar,
research, tax credits, donations to their non-profit corporations) or
are dupes of those people.

Further the proposed solutions will increase the cost of energy to
heat our homes and drive out cars. Increased costs always hurt low
income people the most, and since minorities are over represented in
the lower incomes, **this proposal is racist.**

Thank You
Jim Karlock
