

I would like to know why Oregon is taking the mitigation approach when the Imperial college, London forecasts 20,000 deaths on a population the size of Oregon.

I know the suppression model is tough on the population, China showed what can be achieved in 6 weeks. Italy has show what happens when you leave it too late and ultimately every society has eventually ended up using the suppression model.

How are we going to protect grocery store workers? If we get 20% infection in a grocery store workforce, will the store close? What happens then?

Social distancing is not happening, especially in grocery stores.

Please stop sending out the message that only the old and vulnerable are at risk. Every age group is at risk of being hospitalized. 1 in 5 people infected will end up in hospital. Oregon has 500 beds taken up with covid patients as of yesterday. We do not have enough supplies and do not want to put caregivers at unnecessary risk. Young people are taking on the message that they are not at risk, especially teenagers. The younger people generally do not die but are suffering severe lung damage.

What are the plans to care for children where all the adults are hospitalized in a home. Grand parents are not an option with infected children.
