

Yes, there is climate change but has the science to sufficiently prove the causes been amassed. No, it hasn't. Carbon emissions from cars and homes, airplanes, etc. are not the cause of polar melting. The ozone layer has been damaged but not by the aforementioned causes.

Methane gas fields being released from ocean depths are damaging our atmosphere as oceans are warming but the solutions on the table now miss the mark and will result in a corrupt hoax to bilk citizens out of dollars they don't have. We have to identify the right solutions based in the accurate science!

Legislation based on bad science is evidence of a population being manipulated for corrupt reasons. I'm sure well-meaning people don't want to be part of a gigantic scam, do they?
