

I oppose House Bill 3063. I believe it is every parents right to decide if their child should be vaccinated or not.

1.Vaccines can cause serious and sometimes fatal side effects.

2.Vaccines contain harmful ingredients.

3. The government should not intervene in personal medical choices. Medical decisions for children should be left to the parents or caregivers. Barbara Low Fisher, Co-founder of National Vaccine Information Center, stated, "If the State can tag, track down and force citizens against their will to be injected with biological products of known and unknown toxicity today, there will be no limit on which individual freedoms the State can take away in the name of the greater good tomorrow."

4.Mandatory vaccines infringe upon constitutionally protected religious freedoms. Several religions oppose vaccines and mandatory vaccinations. The First Amendment of the US Constitution states, "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof."

5.Vaccines can contain ingredients some people consider immoral or otherwise objectionable. Some DTaP/IPV/Hib combination, Hep A/Hep B combination, HepA, MMR, and chicken pox vaccines are cultivated in cells from two fetuses aborted in the 1960s (listed as MRC-5 and WI-38 on package inserts). The Catholic Church, in a June 9, 2005 report about using vaccines made using cells from aborted fetuses, indicated that "there is a grave responsibility to use alternative vaccines" to avoid the "evil" of actively or passively participating in anything that involves voluntary abortion. [97] Some vaccines for DTaP, Hep A, RV, Hib, HPV, IPV, flu, MMR, and chicken pox are made using animal products like chicken eggs, bovine casein, insect cells, Cocker Spaniel cells, pig gelatin, and cells from African Green monkeys, making those vaccines conflict with some vegetarian and vegan philosophies. Others consider it problematic that some vaccines are produced using human albumin, a blood plasma protein.

6.Vaccines are unnatural, and natural immunity is more effective than vaccination. Even pro-vaccine organizations state that natural vaccination causes better immunity. The Children's Hospital of Philadelphia notes that "It is true that natural infection almost always causes better immunity than vaccines. Whereas immunity from disease often follows a single natural infection, immunity from vaccines occurs only after several doses." [98] Mayo Clinic states that natural infection "often provides more complete immunity than a series of vaccinations." [99] Kurt Perkins, DC, a chiropractor and wellness expert, stated, "A vaccine violates all laws of natural immune defenses by taking a potential pathogen along with all the TOXIC ingredients (aluminum, formaldehyde, adjuvants, etc.) directly into your blood system. This process would never occur in building natural immunity. That last sentence is kind of an oxy-moron. Immunity is a natural thing. Vaccines are an artificial thing." [100]

7.The pharmaceutical companies, FDA, and CDC should not be trusted to make and regulate safe vaccines. The primary goal of pharmaceutical companies is to sell drugs and make a profit. William Posey, Congressman (R-FL), stated in an Apr. 8, 2014 interview, "The incestuous relationship between the public health community and the vaccine makers and government officials should not be allowed to continue. I mean, you know, too many top CDC personnel go to work for the vaccine makers when they leave. That's a revolving door that creates a serious conflict of interest and perverts incentives that compromise integrity." [101] Julie Gerberding, President of Merck Vaccines, was the CDC director from 2002-2009. [102] A vaccine for Lyme disease, LYMERix, was licensed by the FDA and marketed for almost four years before being pulled from the market after several class action lawsuits were filed due to a potential causal relationship to autoimmune arthritis. [103] Rotashield, a vaccine for rotavirus (RV), was pulled from the market by the manufacturer nine months after it was introduced after it was discovered that the vaccine might have contributed to higher instances of intussusception (bowel obstruction). [104]

8.Most diseases that vaccines target are relatively harmless in many cases, thus making vaccines unnecessary. The chickenpox is often just a rash with blisters and can be treated with acetaminophen, cool compresses, and calamine lotion. [106] The measles is normally a rash accompanied by a fever and runny nose and can be treated with rest and fluids. [107][108] Rubella is often just a virus with a rash

and low fever and can be treated with acetaminophen. [72][109] Rotavirus can normally be treated with hydration and probiotics. [110][111]
