**RE: HB3063** relating to health care declaring an emergency. Removes ability of parents to decline required immunizations on behalf of child for reason other than indicated medical diagnosis.

TO: Oregon Senator and Representatives:

I'm writing in response to the review and concerns of a very sensitive public issue. Our considerable concern for our childrens health and safety in the State of Oregon.

I have grandchildren that had observable affects from received vaccinations. One of my grandchildren (six-month-old) had a noticeable brain inflammation within 12 hours of a DtaP vaccination shot. The soft spot on his upper head just started to swell and push out. It was obvious that there was immense

pressure within his cranium from the vaccination shot. The medical professionals advised his mother and I that it wasn't safe to get that particular vaccine for an infant. They were very discreet about informing us this information? They also did not document their statements to us in his medical file? In short that was the beginning of years of medical attention and positive intense care by his parents. I can't fully describe the heartache we all went through. There was no doubt it was caused by the swelling from the shot.

The following information is just part of documented facts concerning vaccines and their cause of permentant injury and/or death. It brings to the forefront the viability that the vaccines themselves can cause more deviation than the illnesses they protect us from.

Vaccines use to be administered in a sensitive time line. Age of the child receiving the vaccine was a concern. Multiple bundle vaccines were not use when I was younger.

We somewhere lost the idea of how to appropriately and safely control these commutable infectious diseases and arbitrarily went to a maximum amount of vaccines. Give as many vaccines within the first year of birth!

Please read the following information concerning this issue of major concern. It not only explains a small part of the factual data that is finally being disseminated to the voting public. It shows a lack of appropriate decisions without factual bases. Our children need your protection and help. Vaccines need to be monitored, tested, administered appropriately and recipients need to be made aware of the side effects as per FDA requirements. Drug companies shouldn't be shielded from liability. One-day-old babies shouldn't be getting a vaccination injection!

## **SUMMARY**

## U.S. Congress and Institute of Medicine Confirm Government Licensed and Recommended Vaccines Can Cause Injury and Death

Like prescription drugs, vaccines are commercial pharmaceutical products that carry two risks: <u>a risk the vaccine product will fail</u> <u>to work and a risk the vaccine product will cause harm</u>. However, unlike with prescription and over the counter drugs, manufacturers of vaccines and doctors who administer vaccines have no liability when a person is injured or dies after being given a recommended childhood vaccine licensed by the U.S. Food and Drug Administration (FDA) as safe and effective. THE ADVISE OF THESE RISK ARE <u>NOT GIVEN</u> TO VACCINE RECEPERANTS.

In 1986, Congress passed the National Childhood Vaccine Injury Act and codified into law government acknowledgement <u>that state</u> <u>mandated vaccines can and do unpredictably cause injury and</u> <u>death.</u> The Act created a federal vaccine injury compensation program (VICP) alternative to a vaccine injury lawsuit against drug companies. By 2019, the VICP had <u>awarded more than \$4</u> <u>billion in federal compensation to vaccine injured children and</u> <u>adults</u>.

IT HAS BEEN NOTED THAT FEDERAL HEALTH AND HUMAN SERVICES HAS NOT CONDUCTED ANY VACCINE SAFETY TEST IN THE PAST 32 YEARS. THEY WERE REQUIRED BY THE 1986 NATIONAL VACCINE INJURY ACT TO REPORT TO CONGRESS EVERY TWO YEARS.

- There has never been a single study of the current vaccine schedule.
- Combined doses of vaccines have not been tested.
- Neurotoxins: cause brain damage. The extent is the only variable.
- There have not been any official vaccine studies conducted by a party who doesn't financially benefit from vaccine sales.

## Facts regarding administration of vaccines:

- Vaccines contain many, toxic and apparently unnecessary ingredients.
- Bovine (Cow) blood and gelatin cells.
- Chicken blood and egg cells.
- Cells from aborted human fetuses.
- Patented ytoxic chemicals with proven negative biological effets (eg. Triton X-100).

#### **<u>Note:</u>** 55 Organizations Representing 5 Million have recently Serve Legal Notice (currently a law lawsuit) to HHS for Failure to Conduct Vaccine Safety Test:

- HHS had no response to the lack of safety testing, to the fact that they don't have a surveillance system and that their own system was unreliable.
- That there <u>could have been 5.9 million vaccine injuries in</u> <u>America in one year alone.</u>
- HHS Settled the Lawsuit and admitted they failed to conduct vaccine safety testing. HHS advised they did not locate any records to respond to request.

Prior to being licensed every other pharmaceutical drug and product has to go through rigorous randomized double blind placebo testing. Vaccines alone are immune from that. So instead of a five year test with true placebos, vaccines sometimes get only a few hours of safety testing. That is not long enough to spot injuries with long incubation periods like autism, ADHD, food allergies and autoimmune diseases.

In 2011 in a split decision <u>in Bruesewitz v. Wyeth, the US</u> <u>Supreme Court majority ruled that vaccines are "unavoidably</u> <u>unsafe"</u> and effectively removed all liability from drug companies, even if there was evidence a drug company could have made a vaccine safer?

In a series of reports published between 1991 and 2013, the Institute of Medicine affirmed that scientific evidence demonstrates that vaccines can cause injury and death and that some people are genetically, biologically and environmentally at higher risk for being harmed by vaccines but doctors do not know how to identify who they are before vaccination.

## VACCINATIONS: KNOW THE RISKS

Like the first vaccine for smallpox, every vaccine licensed by the U.S. Food and Drug Administration (FDA) and recommended by Centers for Disease Control (CDC) officials and medical trade associations carries a risk for serious complications, such as brain inflammation, which can lead to chronic brain and immune system damage or death. This is what occurred to my grandson. There is a wide spectrum of <u>vaccine complications</u>, which have been identified and acknowledged in the medical literature and by the Institute of Medicine (IOM), National Academy of Sciences, including:

Brain Inflammation/Acute Encephalopathy Chronic Nervous System Dysfunction Anaphylaxis Febrile Seizures Guillain Barre Syndrome (GBS) Brachial Neuritis; Acute and Chronic Arthritis Thrombocytopenia Smallpox, polio, measles and varicella zoster vaccine strain infection Death (smallpox, polio and measles vaccine) Shock and "unusual shock-like state" Protracted, inconsolable crying Syncope Deltoid Bursitis

## Gaps in Knowledge About Individual Risks

In 2013, the IOM published another report, The Childhood Immunization Schedule and Safety: Stakeholder Concerns, Scientific Evidence and Future Studies, which studied the scientific evidence regarding the safety of the CDC's recommended vaccine schedule for children from birth to age six. The IOM committee evaluating the evidence stated <u>that there are</u> <u>significant gaps in scientific knowledge about children, who are</u> <u>biologically at higher risk for suffering vaccine injury and</u> <u>death.</u>

# **Current Early Childhood Vaccine Schedule: More Testing** Needed

The CDC's childhood vaccine schedule recommends all children receive doses of 16 vaccines with 50 doses of vaccines given between the day of birth and age 18. <u>The majority of children in the U.S. today receive three times as many vaccinations as children received in 1983</u>.

The 2013 IOM Committee, which examined the safety of the current federally recommended early childhood vaccine schedule found <u>that it had not been fully scientifically evaluated</u>.

# **Outstanding Questions About Vaccines & Chronic Illness**

Due to a lack of enough methodologically sound studies conducted and published in the medical literature, the 2013 IOM Committee was unable to determine if the early childhood vaccine schedule recommended by the CDC and medical trade associations is or is not associated with the development of the following chronic brain and immune disorders and disabilities in children:

asthma; atopy; allergy; autoimmunity; autism; learning disorders; communication disorders; developmental disorders; intellectual disability; attention deficit disorder; disruptive behavior disorder; tics and Tourette's syndrome; seizures; febrile seizures and epilepsy.

## Vaccine Manufacturer Product Information Package Inserts

The FDA requires vaccine manufacturers to publish certain types of information for licensed vaccines to inform both vaccine administrators and <u>vaccine recipients</u> about the vaccine's vaccine ingredients; ages and circumstances for use of the vaccine; descriptions of vaccine pre-licensure clinical trial results; postmarketing vaccine reaction reports, as well as what the vaccine manufacturer considers a **contraindication (reason not vaccinate) or precaution to use of the vaccine.** <u>THERE IS NO COMPLIANCE WITH THIS FDA</u> <u>REQUIREMENT FOR VACCINE RECIPIENTS</u>.

There is much data to caution us on the use of vaccines oppose to the non-regulatory safety stance of local and Federal government. How is it with these factual concerns the drug companies can go unregulated.

Sincerely,

Joe Diglio 823 Creekside Dr. S.E. Salem, Oregon 97306
