

Thank you for registering my vote to oppose HB 3063.

It is absolutely unethical for the state or government to require medical treatment in exchange for entry into schools - or living a 'normal life.'

I have researched vaccinations extensively and am cautious about not just vaccines but and frankly most medication. In the case of vaccines I am cautious of the adjuvants used (the neurotoxic chemicals which are used to override the immune system so the body circulates the medicine), how they interact with the body's natural immunity immediately or years later, numbers of recommended doses given by the age of 18 (88), the exemption of liability of their manufacturers, that there have been no double blind and scientifically sound research studies proving safety; as well, that the CDC - the agency which develops the schedule also holds many patents for and is making billions of dollars a year on vaccine administration. It's the worst of government corruption when the head of the CDC is also the former CEO of a big pharma company, in my opinion.

As a healthcare practitioner, I am struck every day at the marvel of the human body. Over the years, I have observed how doctors specializing in particular the fields of specialty are just scratching the surface of understanding how the body works. Endocrinology for example - very little is know about how the hormones work. For many years hormones were given to menopausal women - short term, this eased symptoms but years later, hormone medication use was noted to have correlation with hormone related cancers and today are administrated with far more caution. Thankfully.

So very little is understood about the immune system and autoimmune disease diagnoses are more and more common, perhaps effecting half of my patients.

This experiment with vaccines has apparently been beneficial in some regards but to mandate any medication is absolutely unethical. People talk of herd immunity but we don't even really know what it means - All science is a theory. Medical science as well.

Today we are in the midst of an opioid crisis. Oxycontin was the miracle non-addictive, long lasting pain killer or so we were told. Statin drugs, also sold as a medical miracle.

There is no one size fits all.

Thank you for your consideration,

Hilarey Boly
