

**Date:** February 28, 2019  
**To:** Oregon State Legislators  
**Subject:** No on HB 3063

Dear Legislators,

I believe in health freedom, and don't believe that vaccinations, especially with the schedule that exists now in this country, are healthy for every child. I believe that herd immunity is important, but not at the expense of the general health of the herd, and a vaccination schedule that is double that of many other countries. One should have the freedom to pick and choose vaccines and vaccine timing based on their individual health needs. I have grand children who have Lyme's Disease and vaccinations can compromise their immune systems.

A great way to assess vaccine success is by drawing titers. It makes far more sense to evaluate the success of a vaccine, than vaccinating over and over again on a schedule that has not been borne out as safe in the scientific literature, and is based more on theory and hope. As such, we are imposing a scientific experiment on our children, and we have the increasing rates of autism, inflammatory disease, ADD, mental illness and chronic disease to prove it. Titers can reflect the success or failure of vaccination, and indicate further intervention necessary for herd immunity based on individual response than public health theory.

All health interventions are not created equal, and the health status of each individual is not equal. We will create more problems by imposing mandatory vaccination upon our child population by taking away the philosophical and religious vaccine exemptions. Please keep it available and vote against HB 3063

Thank-You,

Anders F. Anderson
