

If you read this article, "The 112-Year Odyssey of Pertussis and Pertussis Vaccines-Mistakes Made and Implications for the Future," you will see that we have a big big problem with our pertussis vaccine.
<https://www.ncbi.nlm.nih.gov/m/pubmed/30793754/>THIS explains the cyclical outbreaks. Not the anti-parent narrative that is spread far and wide by the media. THIS also explains why in the most recent outbreak in LA, EVERY CHILD WHO GOT PERTUSSIS HAD BEEN VACCINATED ==>> <https://losangeles.cbslocal.com/.../whooping-cough-harvard-w.../>).

Yet our state (Oregon) and perhaps yours wants to mandate this vaccine and EXCLUDE children from school if their parents decide this problematic vaccine is not right for their family!

"In the last 13 years, major pertussis epidemics have occurred in the United States, and numerous studies have shown the deficiencies of DTaP vaccines, including the small number of antigens that the vaccines contain and the type of cellular immune response that they elicit. The type of cellular response a predominantly, T2 response results in less efficacy and shorter duration of protection. Because of the small number of antigens (3-5 in DTaP vaccines vs >3000 in DTwP vaccines), linked-epitope suppression occurs. Because of linked-epitope suppression, all children who were primed by DTaP vaccines will be more susceptible to pertussis throughout their lifetimes, and there is no easy way to decrease this increased lifetime susceptibility." ~James D. Cherry, MD, Department of Pediatrics, David Geffen School of Medicine at [UCLA](https://www.ucla.edu/)
