

I have allergies to rye grass and require seasonal use of pseudoephedrine HCL (sudefed). Pseudoephedrine HCL is much superior to pseudoephedrine sulfate. In fact, according to a local pharmacist, it really doesn't work for most people.

In the early years, I could purchase a bottle of 100 little-red pills from Costco for about 3 dollars. Once it became a mandatory doctor's prescription, it tripled in price because they are packaged in bubble packs. The reason for the triple price was artificially induced from the presumed belief that the Meth problem in Oregon was caused by the availability of cheap ingredients to manufacture Methamphetamine. History has borne that out to be false.

Because it requires a doctor's prescription, manufactures of cold medications had to switch to the less (not) effective alternatives. Now, people are buying cold medicine and not getting the relief they so desperately desire. Why are we making these people suffer and for what?!

Regards,

Steve
