

WISE Grid

Wireless is deleterious to health and nature.¹

The Wired, Intelligent, Safe and Effective (WISE) Grid consists of shielded, fiber-optic and copper cables *to and through* the premises – of homes, schools, workplaces and buildings – installing them where they do not now exist and utilizing those that already do. Wired and corded items are fast, clear, safe and secure.² Devices can still be used for all purposes, but for sending and receiving (like calls and down-loading), they must be plugged in.³ The wireless feature is retained for emergencies only. Kiosks, booths and portals can be installed in cafes, restaurants and rest stops where people can plug in when out.⁴
