

At mega-dairies, methane – a highly potent greenhouse gas – off-gasses from the enormous manure lagoons where the waste anaerobically rots. Livestock production is a leading source of methane gas emissions in the United States and manure management is the fastest growing source of methane emissions. This is because factory farms with their massive polluting manure lagoons are rapidly replacing family farms that don't have manure lagoons. We shouldn't support businesses that will have negative impacts on the environment like this one will.
