

HB 3003 STAFF MEASURE SUMMARY

House Committee On Climate, Energy, and Environment

Prepared By: Erin Pischke, LPRO Analyst

Sub-Referral To: Joint Committee On Tax Expenditures

Meeting Dates: 3/6

WHAT THE MEASURE DOES:

Directs Oregon Watershed Enhancement Board to, by rule, identify riparian areas that would derive ecological benefit from the removal of western juniper. Directs the Oregon Department of Energy (ODOE) to, by rule, provide certification to biomass collectors who remove western juniper from riparian areas and sell it to biomass energy producers. Permits ODOE to collect fees for this certification activity. Beginning in tax year 2024, establishes an excise tax credit for electric utilities who purchase energy made from at least 50 percent western juniper biomass. Directs ODOE to verify that qualifying electricity has been produced using at least 50 percent western juniper biomass, and to certify the amount of tax credit that electric utilities are eligible for. Permits ODOE to charge a fee for these activities to electric utilities who are eligible for the tax credit. Allows utilities eligible for the tax credit to, under certain conditions, carry forward the tax credit to a future year no more than twice and/or transfer the credit to another taxpayer. Takes effect on the 91st day following adjournment sine die.

- *REVENUE: May have revenue impact, but no statement yet issued*
- *FISCAL: May have fiscal impact, but no statement yet issued*

Subsequent Referral to Joint Committee On Tax Expenditures

ISSUES DISCUSSED:

EFFECT OF AMENDMENT:

No amendment.

BACKGROUND:

Western juniper is a species of tree native to Eastern Oregon and Northeastern California. In the last 150 years, there has been a 300–1,000 percent increase in acreage occupied by western juniper in Oregon. The species can out-compete rangeland vegetation and is not resistant to fire, which has led to concerns about further spread. Western juniper can be used as biomass—a renewable or recurring organic matter—to produce biofuels, which are processed, ready-to-use energy sources such as liquid, gaseous, or solid fuels. Biofuel is most commonly produced through combustion (burning) of biomass in a process similar to production of coal or natural gas-based electricity.

Biomass was used to generate about five percent of total U.S. energy consumed in 2021. The majority of this energy was consumed by the industrial (48 percent) and transportation (31 percent) sectors, while nine percent was used by electric power producers. In 2020, ODOE reports that 0.4 percent of Oregon electricity was produced from biomass sources. Oregon law (ORS 315.141(3)) previously provided a tax credit for individual or corporate taxpayers who collect biomass used for biofuel production. This tax credit for biomass collection sunset after 2017.

House Bill 3003 would establish a new excise tax credit per kilowatt hour for electric companies or consumer-owned utilities who purchase energy made from at least 50 percent certified western juniper biomass beginning in tax year 2024.
