Committee: House Committee On Emergency Management, General
Government, and Veterans

Measure: HB2601

We've known about the GreenHouse Gas Effect for well over 100 years, and have ignored the overwhelming data and testimonies for the past fifty years. Now that things are literally warming up at an increasing rate with obvious regular tangible events, public and political will is strengthening. It is well past time to take serious action, we have plenty of technical solutions in-hand and countless economic models show that we can save a tremendous amount of money by transitioning quickly. The faster we move, the more money and lives we can save. These are only small steps when much more aggressive action is needed but we do need to begin the work in earnest today.
