Committee: House Committee On Climate, Energy, and Environment

Measure: HB2215

I SUPPORT HB 2215.

Nuclear-fueled thermal power seems to be the best green energy option for the environment with the least amount of emissions. It is not only the cleanest, but the most efficient, reliable, and dependable green energy source. A close second is hydropower because of efficiency and reliability, but even that's been under attack by dam busting pursuits.

Solar and wind energy producing options may have low emissions, but they dirty the environment in other ways and are not reliable or dependable enough to support the demands of our power grid. Not to mention they made in China and repair parts depend on China.

With all the safeguards that have been developed to make nuclear-fueled thermal power withstand natural disasters, where are the green supporters?
