

Submitter: Deena Dexter

On Behalf Of:

Committee: Senate Committee On Energy and Environment

Measure: SB803

This committee, I assume are all using electric vehicles already and have all the infrastructure necessary to run smoothly in their day to day lives. They must have electric trucks and electric farm equipment already being used on their large farms. It would only be reasonable to assume that they already know how this is to work. How is Oregon going to support any transition necessary to comply with this demand of a change over. Already the electric farm equipment is only good for hobby farmers', but it still is a challenge to really get any time or work done waiting for the charge to complete. It is going to be interesting when the large cities are not getting supplies, inventory or anything hauled in if the trucking industry cannot afford to replace their trucks since they are the first to ban diesel vehicles.

Is this going to be an American Made project or is it coming from China? Does the US even have the components necessary to make these batteries, or is it coming from China?

Farmers are the best stewards of the land. They do not contaminate their crops or land since it has to be there to use. You ask a Farmer to feed your country but if the Farmer cannot afford to operate then the farmland is sold... Probably to China.
