

Submitter: Marlene McClintock

On Behalf Of:

Committee: Senate Committee On Energy and Environment

Measure: HB3179

NOTE::

These turbines have 3 blades that are 90 feet in length. The average life of the blades are 9 yrs. And the base has a documented history of dripping oil into the surrounding ground.

The three blades have to be swapped out at least every 9 yrs or sooner and then they are dumping them into our land fills. More importantly, this is taking the Prime Farmland to setup hundreds of new turbines. We need to stop the stealing of our prime farmland.
