On Behalf Of:
Committee: Joint Committee On Transportation
Measure: SB422

While lane splitting is illegal in most of the USA, it is legal and widely practiced in other parts of the world. Lane splitting has several benefits, such as increased safety, reduced traffic congestion, and improved fuel efficiency. One of the most common types of motorcycle accidents is a rear-end collision. Lane splitting can help reduce the risk of these collisions, as motorcycles are able to move through traffic and avoid being stopped in between cars where they are vulnerable to being hit from behind.

When motorcycles are allowed to lane split, they can move through congested traffic more quickly, reducing the overall traffic congestion. This can result in shorter commute times for all road users. The constant starting and stopping of being stuck in traffic can also use more fuel and produce more emissions than when the motorcycle is moving steadily. By allowing motorcycles to lane split, they can avoid being stuck in traffic and can reduce their overall carbon footprint.
