

## How will canola cross with other *Brassica* seeds?

The **Triangle of U** is a theory about the evolution and relationships between members of the plant genus *Brassica*. The theory states that the genomes of three ancestral species of *Brassica* combined to create three of the common contemporary vegetables and oilseed crop species. It has since been confirmed by studies of DNA and proteins. The theory was first published in 1935 by Woo Jang-choon, whose name was transliterated as “Nagaharu U.”
