

Submitter:	Brian Stewart
On Behalf Of:	Electrify Now
Committee:	House Committee On Climate, Energy, and Environment
Measure, Appointment or Topic:	HB4080

Please support this bill to enable energy consumers in Oregon to lower their electricity bills with plug in solar panel systems with a maximum of 1,200 watts. This is proven, safe and cost effective technology that helps address rising energy costs and increases clean energy generation without the need for subsidies, tax incentives or other measures. These systems have proven their ability to scale in Europe where adoption is widespread, and other states in the US, such as Utah, are in the process or have already approved these systems for use in homes and apartments. These products do not compete with large rooftop systems or threaten the jobs of electricians and installers in that industry - they are the perfect solution for people who cannot afford those larger systems, or for renters who do not own their roofs, or for situations where rooftop solar is impractical due to tree coverage. This common sense legislation should be an easy win for energy consumers in Oregon.

Thank you for all you do to make Oregon a wonderful place to live.
